1. (Cancelled).

2. (Cancelled).

3. (Cancelled).

4. (Cancelled).

5. (Cancelled).

6. (Cancelled).

7. (Cancelled).

8. (Cancelled).

9.(New) Device for authenticating the taking of pictures made up of digital data comprising a picture taking apparatus and a security element carrying out the signing of at least part of the digital data, wherein the security element is a detachable element comprising a circuit associated with a secret key K1 giving output digital data, which are a signature of digital data at the input, the detachable element and the associated secret key K1 being specific to a user, this detectable element connecting up to the picture taking apparatus by an interface circuit provided in the picture taking apparatus.

10. (New) Device according to Claim 9, wherein the detachable element incorporates a hashing circuit.

11. (New) Device according to Claim 9, wherein the detachable element is a chip card.
12. (New) Device according to Claim 9, wherein the picture taking apparatus further comprises a multiplexing circuit and a circuit for hashing at least one first fraction of the digital data in such a way as to generate a first hashed datum, the circuit associated with the secret key K1 of the chip card carrying out the processing of the first hashed datum in such a way as to generate a signature of the first hashed datum, the signature and the digital data being transmitted to the multiplexing circuit so as to constitute a multiplexed signal.
13. (New) Device according to Claim 10, wherein the picture taking apparatus further comprises a multiplexing circuit, the chip card comprising a hashing circuit carrying out the hashing of at least a first fraction of the digital data originating from the picture taking apparatus in such a way as to generate a first hashed datum and the first hashed datum is processed in the circuit associated with the secret key K1 in such a way as to generate a signature of the first hashed datum, the signature emanating from the chip card and the digital data being transmitted to the multiplexing circuit in such a way as to constitute a multiplexed signal.
14. (New) Device according to Claim 9, wherein the picture taking apparatus is a camera head.
15. (New) Device according to Claim 9, wherein the picture taking apparatus is a photographic apparatus.
16. (New) System comprising a device for authenticating the taking of pictures made up of digital data comprising a picture taking apparatus and a security element carrying out the signing of at least part of the digital data, the security element being a detachable element comprising a circuit

associated with secret key K1, the detachable element and the associated secret key K1 being specific to a user, this detachable element connecting up to the picture taking apparatus by an interface circuit provided in the picture taking apparatus and a device for authentication digital data coming from the device for authenticating the taking of pictures, said device for authenticating the digital data_ comprising a demultiplexer for separating the digital data and the signature, a circuit with public key K2 for calculating a new datum on the basis of the signature, a circuit for hashing at least one second fraction of the digital data emanating from the demultiplexer in such a way as to generate a second hashed datum, a comparison circuit for comparing the new datum with the second hashed datum in such a way as to constitute a signal making it possible to verify the authenticity of the digital data.
